

Introduction into Cosite Interference

Agenda

- ▶ What is cosite interference?
- ▶ Interference mechanisms and their effects
- ▶ How to regain communications range in the presence of interference?

What is a Cosite Interference Environment?

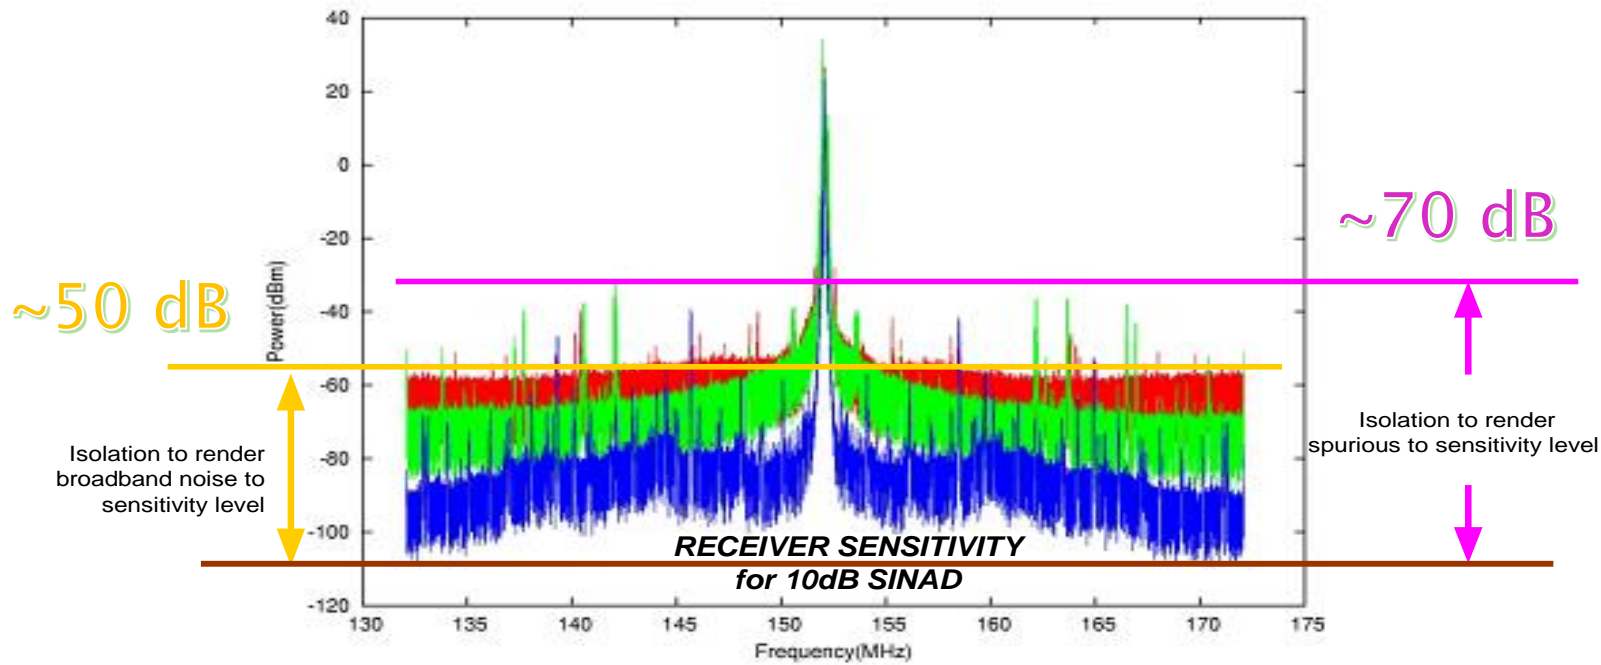

- Phenomena that occurs when multiple RF systems operate close-in without sufficient antenna isolation
 - Isolation is typically gained by physical separation
- **This is difficult to achieve on mobile platforms where surface area and installation locations are limited!**

Cosite Interference Environment

How does Cosite Interference affect a Comms System?

- **Broadband noise, intermods, spurious signals and harmonics** from the transmitter artificially raise the system noise floor for co-located receivers – even if the RF systems are on different frequencies
- The end result is system desensitization and **diminished communications range**

The Conundrum, illustrated

Imagine trying to hear a mosquito while you watched the final Space Shuttle launch...

That's what it's like for a receiver with -110 dBm sensitivity to operate in the presence of a 10 Watt transmitter!

Cosite Interference Impact on Range

Radio Range Reduction Due to Interference

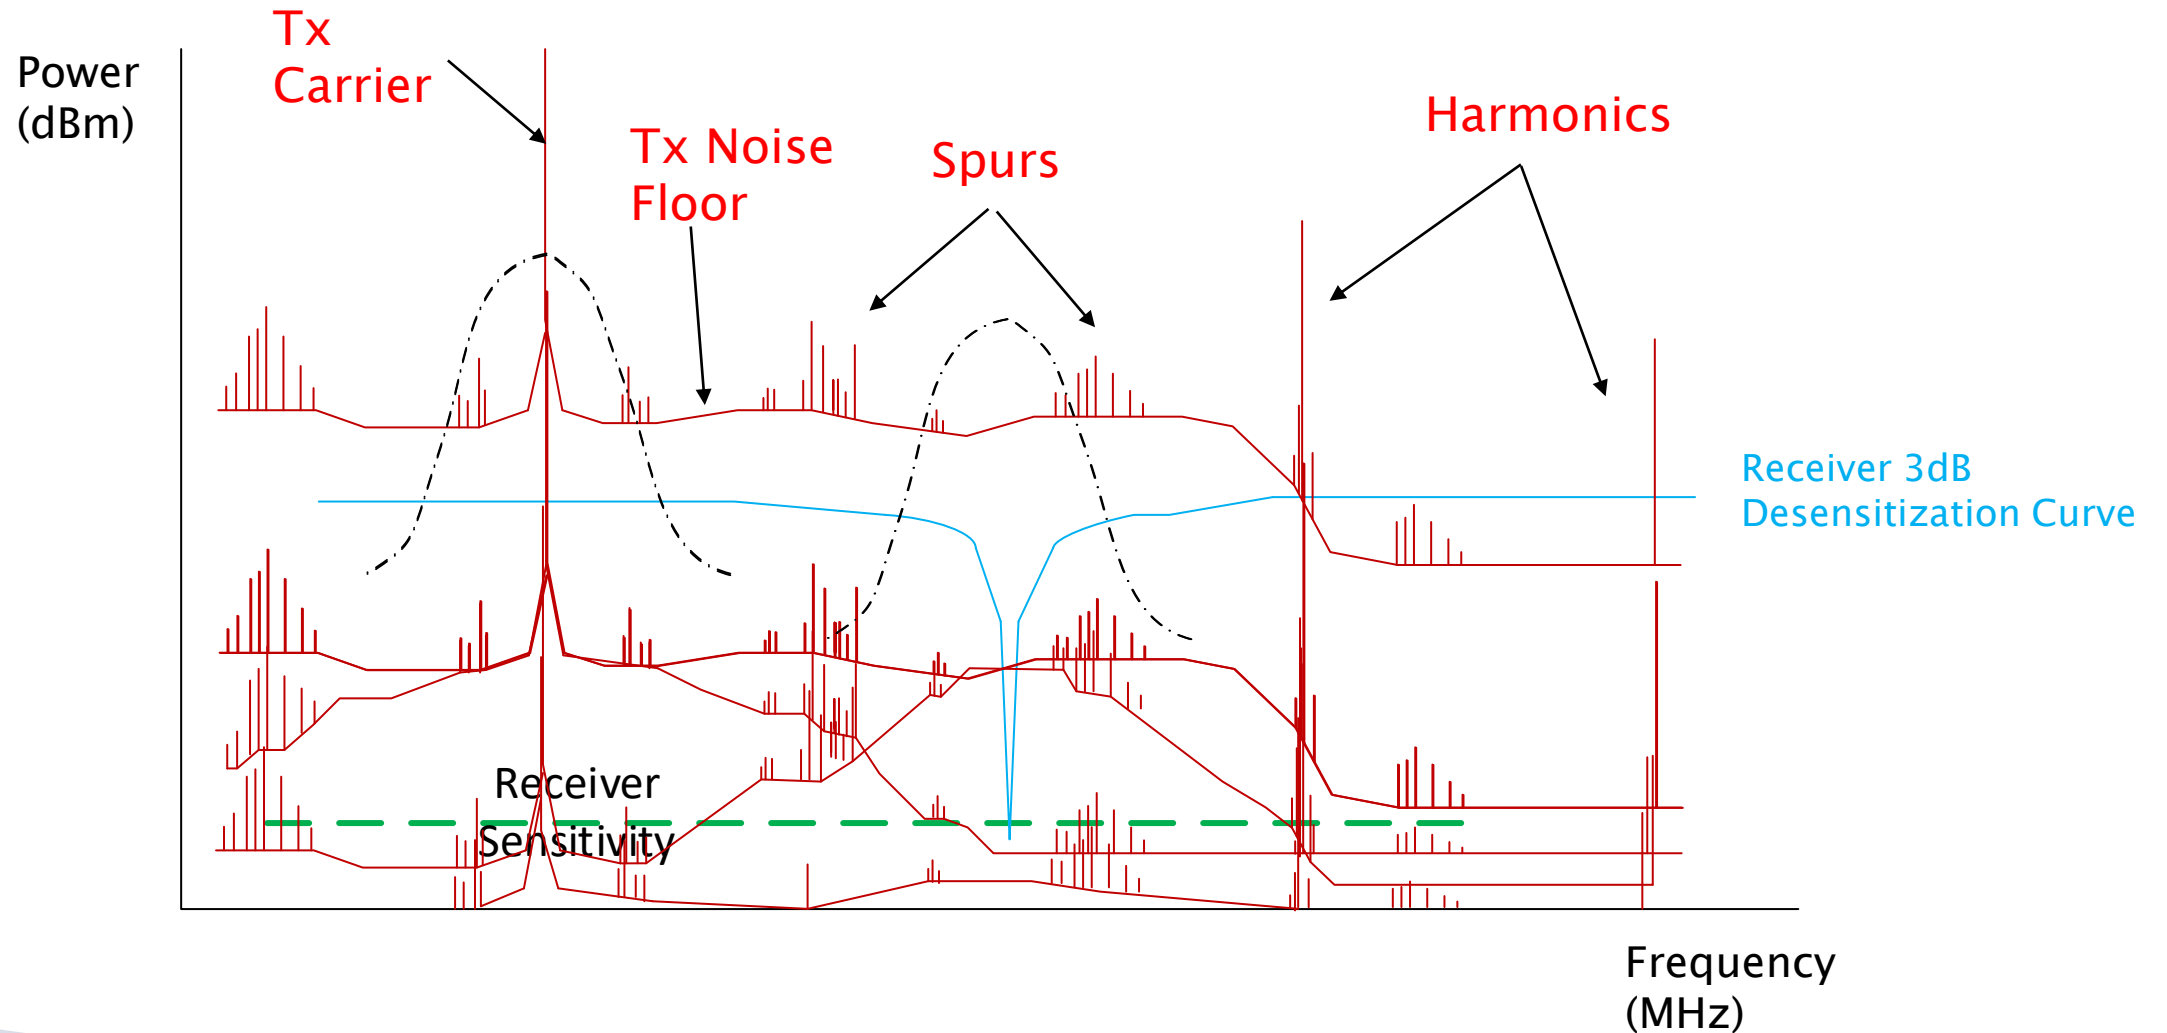

Every 6 dB loss halves the remaining range...

A 20 dB desensitization of your receiver results in the **loss of 90%** of your range!

Interference Mechanisms and their Effects

Interference Types And Mitigations

Interference Scenarios: Airborne

- ▶ Command & control and targeting aircraft carry dozens of RF systems
 - Even widebody aircraft (e.g. 747) can have cosite issues
- ▶ UAS carry comms relays with multiple antennas

Interference Scenarios: Seaborne

- ▶ Crowded antenna masts onboard ships = insufficient isolation

Interference Scenarios: Ground

- ▶ Forward-operating ground elements carry more RF systems for communications and electronic warfare than ever before

Options for a Cosite Interference Environment

- ▶ Acceptance of significantly reduced range
- ▶ Time division multiplexing all RF systems
- ▶ Factory upgrades to existing RF systems
- ▶ Implementation of auxiliary RF cosite interference mitigation solutions

Why don't the radio vendors build this in?

- ▶ There is no silver bullet – each cosite environment is unique
- ▶ The cost of incorporating advanced cosite circuitry (e.g. filtering, amplification, cancellation) inside every tactical radio is prohibitive
- ▶ Radio chassis do not have enough internal real estate to incorporate advanced cosite mitigation circuitry

Cosite Interference Mitigation Solutions

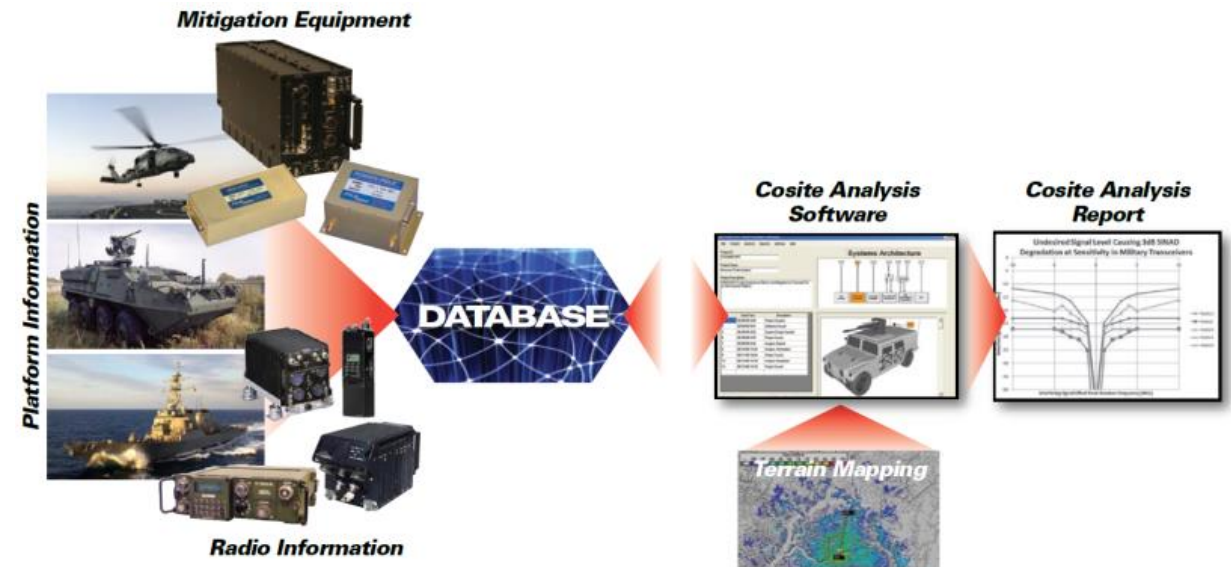

Integrated Cosite Equipment (ICE)

- Filter/Amplifier Systems
- Canceler Systems

Cosite Analysis & System Integration

- Characterize unique cosite environments

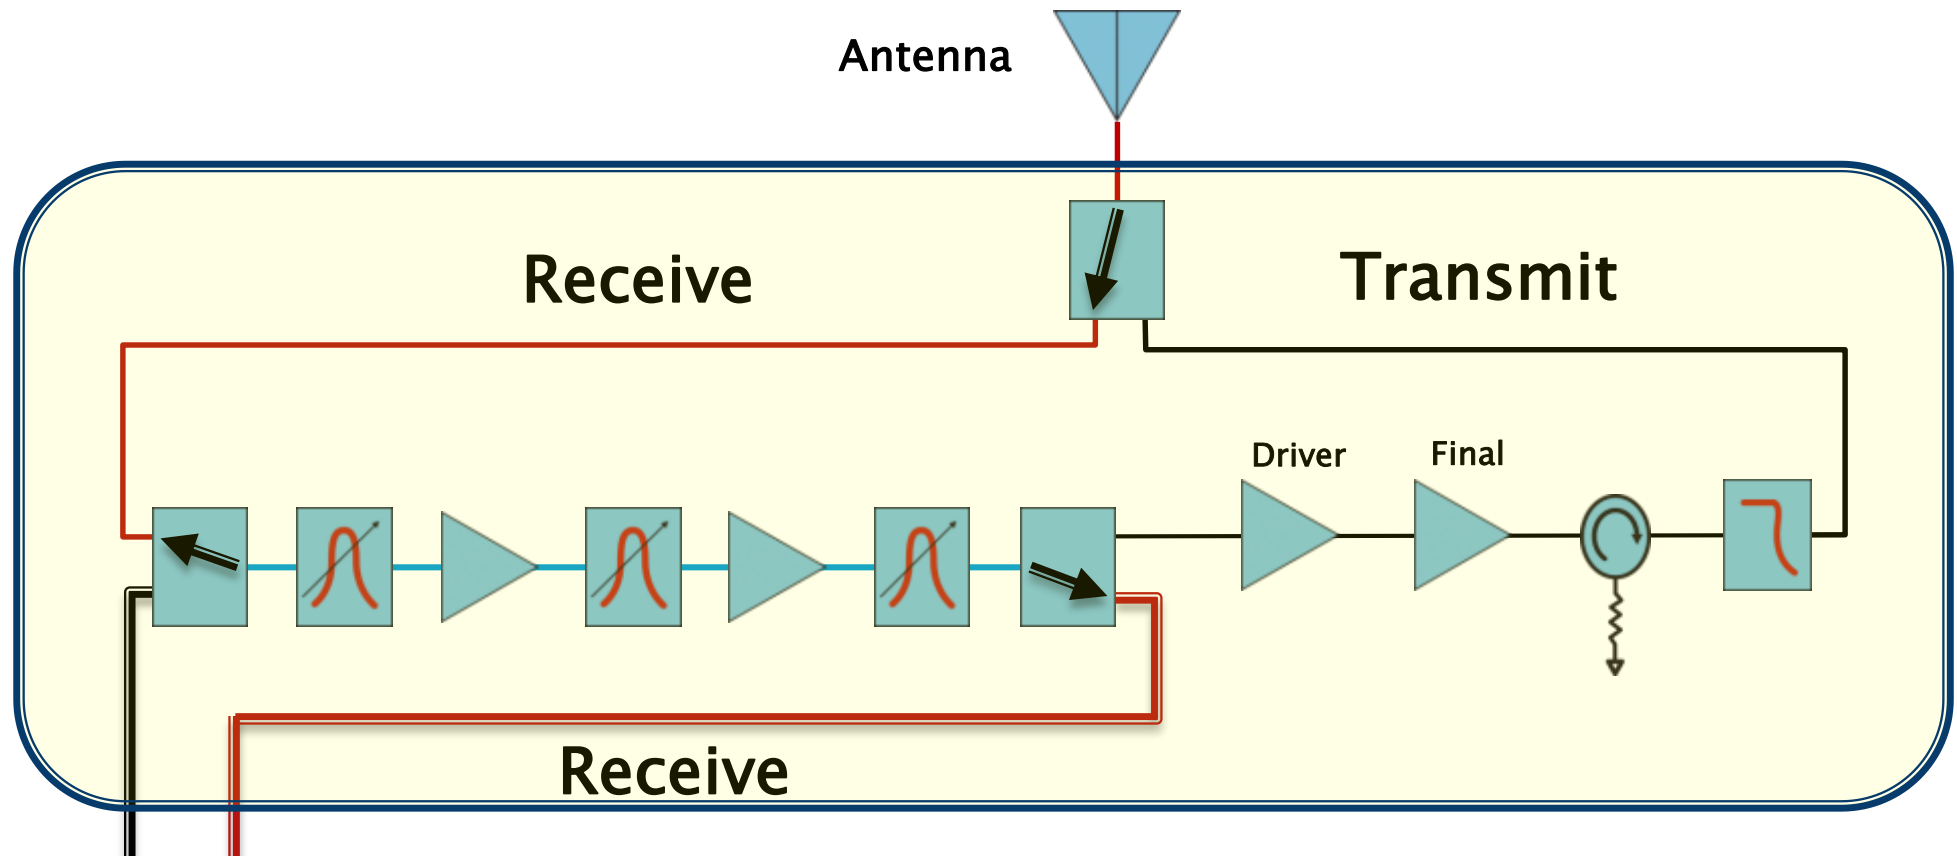

ICE – Filter/Amplifier System

ICE
Filter / Amplifier

Transceiver

- Combines Low Noise Amplifier, Power Amplifier, Agile Filters, and ancillary functions into a single box
- Purifies transmitter output to reduce effects on collocated receivers
- Protects receivers to enhance the user's ability to communicate

Potential Impact of ICE Filter/Amplifier

An Example of Receiver Performance Improvement with ICE

Receiver Performance **without ICE**

Transceiver

Noise figure = 12 dB
Receiver IF BW = 38 kHz
Sensitivity = -106 dBm
Interference Susceptibility
(5% removed) = -23 dBm
(10% removed) = -23 dBm

ICE Enhancement

8 dB

8 dB

32 dB

56 dB

Cosite Enhanced Performance **with ICE**

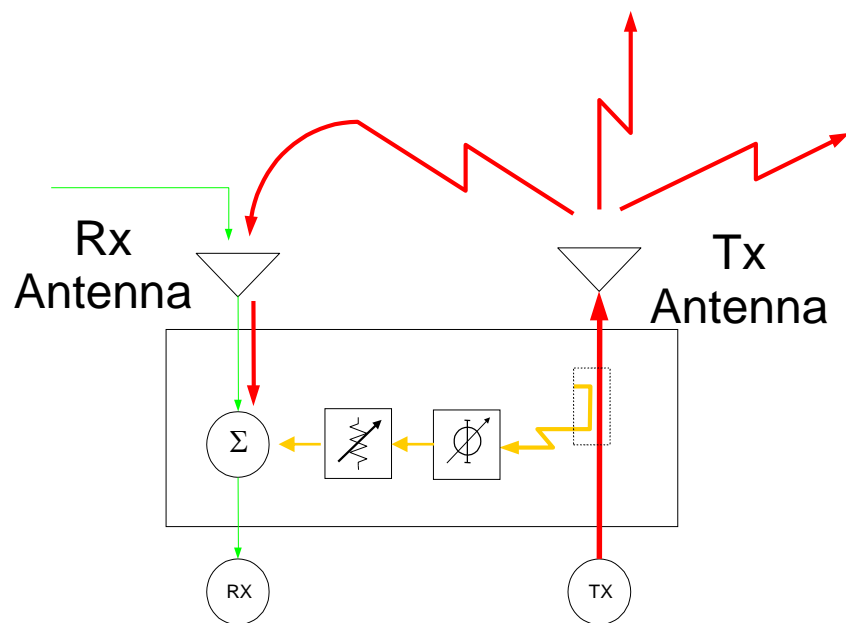

Noise figure = 4 dB
Receiver IF BW = 38 kHz
Sensitivity = -114 dBm
Interference Susceptibility
(5% removed) = 9 dBm
(10% removed) = 33 dBm

Integrated
Cosite
Equipment

Transceiver

ICE – Canceler System

Canceler Offerings

- **Referenced** – Counters colocated interferer(s) (“spectral fratricide”)
 - Model: Multichannel Interference Canceler (MIC)
 - Interferer signal couples to receiver and is conditioned for canceling
 - 5 Channels, combination of VHF and UHF
- **Referenceless** – Counters off-board interferer(s)
 - Model: ICE2004
 - Intelligently identifies interfering signals and cancels up to 8 unique interferers
 - Highly configurable to meet mission needs
